

AMAZON SALES ANALYSIS

Power BI Dashboard & Business Insights Report

Prepared by	Chandan Singh
Project Type	Data Analytics / Business Intelligence
Primary Tool	Microsoft Power BI
Supporting Tool	Microsoft Excel
Report Date	August 2026

Analyzing sales, products, fulfilment, customers and geographical performance using Power BI.

1. Project Overview

This project analyzes Amazon sales data using Microsoft Power BI to transform transactional data into an interactive business dashboard. The analysis focuses on sales performance, product categories, fulfilment methods, order status, customer segmentation and geographical distribution.

The dashboard is designed to help business users identify high-performing areas, monitor operational patterns and support data-driven decisions.

2. Project Objectives

- Analyze overall sales, order volume and quantity performance.
- Identify monthly sales trends and changes over time.
- Compare sales across product categories, sizes and sales channels.
- Evaluate Amazon and Merchant fulfilment performance.
- Analyze courier and order-status distributions.
- Identify high-performing states and cities.
- Compare B2B and Non-B2B order participation.
- Present findings through an interactive and easy-to-use Power BI dashboard.

3. Tools & Methodology

Tool / Component	Purpose	Output
Power BI	Data loading, modelling, visuals and dashboard design	Interactive dashboard
Power Query	Data preparation and data-type validation	Analysis-ready data
Excel / Source Data	Source data and initial validation	Structured sales dataset

4. Dashboard Structure

- Cover / Navigation Page — professional entry point to the dashboard.
- Sales Overview — KPIs, monthly sales, category performance, fulfilment, size and sales channel analysis.
- Customer & Geographic Analysis — state/city performance, courier and order status, B2B segmentation and quantity analysis.

5. Sales Overview

The Sales Overview page provides a high-level view of business performance with KPI cards and interactive Date, Category and Fulfilment slicers.

- Total Sales
- Total Orders
- Total Quantity
- Average Order Value
- Monthly Sales Trend
- Sales by Category
- Fulfilment-wise Sales
- Size-Wise Sales
- Sales by Sales Channel
- Quantity Sold by Category

6. Product Analysis

Product performance is evaluated using category-wise sales, size-wise sales and quantity sold by category. These views help identify demand concentration and support inventory and promotional planning.

- Sales by Category
- Size-Wise Sales
- Quantity Sold by Category

7. Fulfilment Insights

Fulfilment analysis compares Amazon and Merchant fulfilment and examines courier and order-status distributions to support operational monitoring.

- Fulfilment-wise Sales
- Courier Status Distribution
- Order Status Distribution
- Sales Channel comparison

8. Customer & Geographic Insights

This analysis focuses on customer segmentation and location-based performance.

- Top 10 States by Sales
- Top 10 Cities by Sales
- B2B vs Non-B2B Orders, State, City and B2B slicers

9. Key Insights

The dashboard enables the following business insights. Exact values and percentages should be taken directly from the final Power BI visuals rather than estimated.

Product demand: Category, size and quantity visuals identify the strongest areas of product demand.

Fulfilment mix: Amazon versus Merchant analysis highlights the relative contribution of each fulfilment method.

Geographical concentration: Top-state and top-city views identify locations contributing most strongly to sales.

Order operations: Courier and order-status distributions reveal completed, cancelled, unshipped and other operational outcomes.

Customer segmentation: B2B versus Non-B2B analysis shows the relative participation of business customers.

Time trend: Monthly sales trends help identify stronger and weaker periods for planning.

10. Business Recommendations

1. Prioritize inventory and promotions around consistently high-performing categories and sizes.
2. Use state and city performance to support regional marketing and inventory allocation.
3. Monitor cancelled and unshipped orders to identify operational improvement opportunities.
4. Review fulfilment performance regularly to maintain service quality and control costs.
5. Use monthly sales trends for demand forecasting, campaign planning and inventory preparation.
6. Explore targeted B2B acquisition strategies where business-customer participation is relatively low.
7. Refresh the dashboard periodically so decisions are based on current data.

11. Conclusion

The Amazon Sales Analysis dashboard converts transactional sales data into a practical business intelligence solution. It combines sales KPIs, product analysis, fulfilment monitoring, customer segmentation and geographical analysis in an interactive Power BI environment. The dashboard can support management in identifying performance patterns, improving operational monitoring and making informed sales and inventory decisions.
